2.0 CHEMICAL SAFETY

2.1 BACKGROUND

Chemical safety is an integral part of a Laboratory Environmental Health and Safety program. This section will outline regulatory requirements, risk and controls associated with chemical usage and ways to minimize potential chemical risks.

2.2 REGULATIONS

It is the policy of the University to provide a safe and healthy workplace in compliance with the Occupational Safety and Health Act of 1970 and with the following regulations:

- OSHA 29 CFR 1910.1450, *Occupational Exposure to Hazardous Chemicals in Laboratories*
- International Air Transport Association and Dangerous Goods Regulations
- U.S. Environmental Protection Agency (EPA) 40 CFR 260 – 272, *Hazardous Waste Management*

The full OSHA standard can be found on the following link:

2.3 LABORATORY SAFETY COMMITTEE

Safety Committees are a critical component in creating a healthy and safe work environment at University. There are numerous local, state and federal regulatory issues that must be addressed regularly and the committee structure will allow the University to
distribute changes in regulatory requirements and to obtain compliance with regulatory requirements campus-wide with minimal interruption to ongoing research.

One representative from each Department at the University is required to attend each meeting, unless it is specified as optional. The function of this committee will be to serve as the primary link between the research community and the Howard University facility management group, including the EH&S office.

The safety committee meets on a quarterly basis. The meetings are used to provide updates on health and safety policies/procedures at the University and any facility related changes or concerns. Committee members serve as primary contact for EH&S issue and assist in the completion of corrective actions required as a result of inspections by the University EH&S and outside regulatory agents. Departments are also expected to create their own safety committee that will meet at least six times per year.

2.4 RISK ASSESSMENT

A risk assessment should be performed prior to the start of any new project or prior to beginning work with any new process or material that may pose a risk to the health and safety of the laboratory workers. The risk assessment should include hazard identification and an analysis of the probability that workers are exposed to the hazard(s) identified. Once this is completed, recommendations for work practice, engineering controls and proper training must be evaluated and established.

2.5 CONTROL BANDING

Control banding is a generic technique that determines a control measure (e.g., dilution ventilation, engineering controls, containment) based on a range or “band” of hazards (such as skin/eye irritant, very toxic, carcinogenic) and exposures (small, medium, large). The principle of control banding was first applied to dangerous chemicals, chemical mixtures, and fumes. The control banding process emphasizes the controls needed to prevent hazardous substances from causing harm to people at work. The greater the potential for harm, the greater the degree of control needed to manage the situation and make the risk “acceptable.”

Source: [http://www.cdc.gov/niosh/topics/ctrlbanding/](http://www.cdc.gov/niosh/topics/ctrlbanding/)
Materials are first placed into a "hazard band." Factors used to decide which band a product belongs to include:

- Toxicity of the material (how "poisonous" a material is)
- Ease of exposure (e.g., how easy it is for the material to get into a worker's body such as how fine (dusty) or volatile a product is)
- Type of work process being used (e.g., grinding vs. transferring)
- Duration of exposure (amount of time doing the task)
- Quantity of material used in task (small vs. large amounts)

In the example below, the bands represent levels of control: band 1 is low control, while band 4 is the highest amount of control. These bands are based on increased toxicity of the products being used. For example, a skin irritant that is only used in tiny amounts would require less stringent controls than a cancer-causing chemical.

<table>
<thead>
<tr>
<th>Band No.</th>
<th>Hazard Group</th>
<th>Control</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Skin and/or eye irritant</td>
<td>Use good industrial hygiene practice and general ventilation.</td>
</tr>
<tr>
<td>2</td>
<td>Harmful on single exposure</td>
<td>Use local exhaust ventilation.</td>
</tr>
<tr>
<td>3</td>
<td>Severely irritating and/or corrosive</td>
<td>Enclose the process.</td>
</tr>
<tr>
<td>4</td>
<td>Very toxic on single exposure; reproductive hazard; sensitizer</td>
<td>Seek expert advice.</td>
</tr>
</tbody>
</table>

Another example is a decision matrix for control selection. Note in this example:

- High ease of exposure AND high health hazard (i.e., high risk) = Stringent control (isolation)
- Medium ease of exposure AND medium health hazard (i.e., medium risk) = Engineering controls (often includes ventilation requirements)
- Low ease of exposure AND low health hazard (i.e., low risk) = Dilution ventilation (least stringent controls)
<table>

2.6 LABORATORY DESIGN

The primary purpose of these design criteria is to establish minimum design requirements for laboratories to provide a safe work environment and prevent undesirable exposures to chemical contaminants among students, faculty, and staff in laboratories.

These design criteria are minimum design standards required for all new construction and renovation projects involving laboratory furniture and fume hoods in Howard facilities. Individual institutions may have more stringent requirements.

Standard References:

- National Fire Protection Association (NFPA) 45, Standard on Fire Protection for Laboratories Using Chemicals
- NFPA 30, Flammable and Combustible Liquids Code
- NFPA 70, National Electric Code
- American National Standards Institute/American Industrial Hygiene Association (ANSI/AIHA) Z9.5, Standard for Laboratory Ventilation
- ANSI/AIHA Z358.1, Standard for Emergency Eyewash and Shower Equipment
- American Society for Heating, Refrigeration and Air Conditioning Engineers (ASHRAE) Standard 55, Thermal Environment Conditions for Human Occupancy
- ASHRAE 110-R, Method of Testing the Performance of Laboratory Hoods
OSHA 29 CFR 1910.1450, Occupational Exposure to Hazardous Chemicals in Laboratories

New laboratory construction and renovation projects require a system test and balance report to verify proper heating, ventilating, and air-conditioning (HVAC) system and fume hood operation before the building or area will be accepted, or occupied, by the institution.

Fume hoods shall not be installed or used primarily for chemical storage. Laboratories where potentially hazardous chemicals or agents are used shall have negative air pressurization relative to surrounding space, and HVAC systems shall be designed to provide 6-10 air changes per hour, depending on use of laboratory space.

In addition, chemical storage cabinets (e.g., flammable, corrosive, acid, caustic) will be used to segregate chemicals and to provide additional protection in the case of an emergency.

2.7 STORAGE REQUIREMENTS

Chemicals must be stored in a manner suited for each chemical’s properties. All chemicals have specific properties that may make them incompatible with other chemicals or materials. This section outlines several different types of chemicals and the storage requirements associated with each:

1. Acids
2. Bases
3. Flammables
4. Oxidizers
5. Water Reactives
6. Pyrophorics
7. Peroxide Forming Chemicals
8. Toxic Chemicals
9. Carcinogens
10. Teratogens

The lists below are not all inclusive, but include many of the most-commonly used materials in research laboratories.

2.7.1 Acids

- Store on low shelves or in acid cabinets.
• Segregate oxidizing acids from organic acids as well as flammable or combustible materials (see lists below).
• Use bottle carriers for transporting acid bottles.
• Have spill control materials available which will absorb and neutralize an acid spill.

_Strong Oxidizing Acids_—nitric acid, sulfuric acid, chromic acid, perchloric acid, hydrobromic acid

_Organic Acids_—acetic acid, acetic anhydride, phenol, trichloroacetic acid, trifluoroacetic acid

_Other Common Acids_—hydrochloric acid, phosphoric acid, formic acid, maleic acid, phosphotungstic acid

### 2.7.2 Bases

• Store bases on low shelves or in designated caustics cabinets.
• Segregate bases from acids.
• Have spill control materials available which will absorb and neutralize a base spill.

_Common Bases_—ammonium hydroxide, calcium hydroxide, potassium hydroxide, sodium hydroxide, bicarbonate salts (potassium bicarbonate, sodium bicarbonate, etc.), carbonate salts (calcium carbonate, sodium carbonate, etc.)

### 2.7.3 Flammables

• Store volumes greater than one gallon (four liters) in approved safety cans.
• Store in flammable storage cabinets.
• Keep away from heat and ignition sources (burners, heat-producing equipment, sunny windows, etc.)
• Keep firefighting equipment such as extinguishers accessible and unobstructed.
• Have flammable spill materials available. Activated charcoal absorbent is recommended.
• If flammables must be kept cold, use only a lab-safe refrigerator or freezer (electrical components mounted on the outside) or keep flammables on ice for as long as they are needed cold.
Never store flammables in cold rooms. Most cold rooms are not sprinklered and all have recirculating air, which can allow dangerous levels of ignitable vapors to build up.

*Flammable Solids*—benzoyl peroxide, picric acid

*Flammable Gases*—acetylene, ammonia, butane, carbon monoxide, ethane, ethylene oxide, formaldehyde, hydrogen, hydrogen sulfide, methane, propane, propylene

*Flammable Liquids*—acetaldehyde, acetone, acetyl chloride, alcohols, benzene, butanol, p-dioxane, ethanol, ethyl acetate, ethylamine, ethyl benzene, ethyl ether, ethyl formate, furans, gasoline, hexane, hydrazine, isopentane, isopropyl ether, methanol, methyl acrylate, 2-methylbutane, methyl butyl ketone, methyl ethyl ketone, methyl methacrylate, morpholine, naphtha solvents, octane, piperidine, propanol, pyridine, Sigmacote, styrene, TEMED, tetrahydrofuran, toluene, turpentine, vinyl acetate, xylene

### 2.7.4 Oxidizers

- Store in a cool, dry place.
- Keep away from flammable and combustible materials.
- Keep away from reducing agents.
- Dispose of as hazardous waste.

*Oxidizing Liquids*—bromine, chromic acid, hydrogen peroxide, nitric acid, perchloric acid, sulfuric acid

*Oxidizing Solids*—ammonium dichromate, ammonium perchlorate, ammonium persulfate, benzoyl peroxide, calcium hypochlorite, salts of chlorates, chromium trioxide, ferric nitrate, salts of iodates, iodine, magnesium perchlorate, manganese dioxide, salts of nitrates, periodic acid, salts of peroxides, potassium dichromate, potassium permanganate, potassium persulfate, silver nitrate, sodium chlorite, sodium dichromate, sodium nitrite, sodium perborate

*Oxidizing Gases*—chlorine, chlorine dioxide, fluorine, nitrogen dioxide, nitrogen oxide, oxygen, ozone
2.7.5 Water Reactive Chemicals

(React strongly with water, yielding flammable or toxic gases or other hazardous condition).

- Store in a cool dry place.
- Do not store on shelves over sinks or water baths or near any other sources of moisture.
- In case of fire, keep water away.
- Dispose of as hazardous waste.

**Solids**—anhydrous aluminum chloride, ferrous sulfide, lithium*, lithium aluminum hydride, magnesium, maleic anhydride, phosphorus, phosphorus pentachloride, phosphorous pentasulfide, potassium*, sodium*, sodium borohydride

* Lithium, potassium and sodium should be stored under kerosene.

**Liquids**—acetyl chloride, chlorosulfonic acid, hydrofluoric acid, phosphoryl trichloride, Sigmacote, silicon tetrachloride, stannic chloride, sulfur chloride, sulfonyl chloride, thionyl chloride, titanium tetrachloride, triethylaluminum

2.7.6 Pyrophoric Chemicals

(Ignite spontaneously upon contact with air)

- Must be stored in accordance with manufacturer’s recommendations under an inert atmosphere and at the appropriate designated temperature.
- Pyrophorics that are required to be kept cold must be stored in an explosion-proof refrigerator or freezer that is rated for flammable storage.
- In case of fire, a Class D fire extinguisher must be available. Pyrophoric materials are also often water-reactive, keep water away.

<table>

<td>Chromium*</td>
<td>2-Furaldehyde</td>
<td>Nickel*</td>
<td>Zinc*</td>
</tr>
</tbody>
</table>

* Finely divided metals form a pyrophoric hazard
2.7.7 Peroxide Forming Chemicals

(Chemicals that, over time, can auto oxidize to form explosive levels of peroxides)

- Store in airtight containers in a dark, cool and dry place.
- Label containers with date received, date opened and date of recommended disposal.
- Dispose of peroxide forming chemicals on or before their expiration date. If no expiration date is listed, contact [add client number] for assistance.
- Peroxide inhibitors, often added to these chemicals, may not be sufficient to control peroxide formation once a container is opened.
- Test periodically for the presence of peroxides. Test strip kits are available through laboratory safety suppliers, contact [add client number] for more information.
- Do not attempt to open containers that are very old, visibly crystallized or cracked.
- Dispose of as hazardous waste.

If testing for peroxides is not done, do not keep chemicals for longer than the following times:

3 Months—Isopropyl ether, potassium metal

12 Months—Acetal, butadiene, cumene, cyclohexane, 4-Dioxane (p-Dioxane), diacetalyn, dicyclopentadiene, ethyl ether, methyl butyl dimethyl ether, tetrahydrofuran, vinyl acetate, vinyl chloride, vinyl ethers, vinyl pyridine

2.7.8 Carcinogens

(Chemicals proven or suspected to cause cancer in humans)

- Label all containers ‘Carcinogen’ or ‘Cancer Suspect Agent’.
- Take proper precautions to avoid exposures.
- Dispose of as hazardous waste.

OSHA Subpart Z lists the following compounds as carcinogens.

- 4-Nitrobiphenyl
- bis-Chloromethyl ether
- beta-Propiolactone
- alpha-Naphthylamine
- beta-Naphthylamine
- 2-Acetylaminofluorene
- methyl chloromethyl ether
- Benzidine
- N-Nitrosodimethylamine
2.7.9 Teratogens

(Chemicals known or suspected to cause reproductive harm including the potential to disturb the development of the embryo or fetus or cause birth defects)

- Label all containers ‘Teratogen’ or ‘Reproductive Toxin’.
- Take proper precautions to avoid exposures.
- Dispose of as hazardous waste.

Aniline  Carbon monoxide  Lead  Radioactive substances
Benzene  Carbon tetrachloride  Mercury  Toluene
Carbon disulfide  Chloroform  Phosphorous  Turpentine

2.8 CHEMICAL HYGIENE PLAN

2.8.1 Purpose

The following section presents the Chemical Hygiene Plan (CHP) required by the above mentioned regulations. The purpose of the CHP is to describe proper practices, procedures, equipment, and facilities for employees, students, visitors, or other persons working in each laboratory at the University to protect them from potential health hazards presented by chemicals used in the laboratory workplace and to keep exposures below specified limits. It is the responsibility of administration, research, and supervisory personnel to know and to follow the provisions of this plan. The CHO, or Department Chair, is responsible for developing, implementing, monitoring, and updating the plan annually. Affected departments are all those maintaining laboratories that contain and use hazardous chemicals, as defined by the regulations.

2.8.2 Development, Implementation and Update

The CHO oversees the preparation of the CHP, specifically the standard operating procedures (SOPs) for the laboratory. The CHO is responsible (per OSHA regulation) for
ensuring that the plan meets the requirements set forth in the 29 CFR 1910.1450 and is fully implemented.

The CHO is responsible for ensuring that the CHP is reviewed on an annual basis and updated as necessary to accommodate changes in OSHA standard 29 CFR 1910.1450, departmental procedures, and personnel policy. In addition, the CHO will ensure that the CHP update includes procedures regarding new hazards and new processes as they are introduced.

The CHO will ensure that the CHP and updates are distributed or made available to those affected by the changes.

2.8.3 Employee Exposure Assessment

The University EH&S Office will perform exposure monitoring, when appropriate, in accordance with Paragraph (d) of OSHA 29 CFR 1910.1450 or other applicable OSHA standards. Other qualified consulting service providers may be employed by the University EH&S Office to conduct such monitoring. All monitoring results will be kept on file in the University EH&S Office. A report summarizing the results of the exposure monitoring will be provided to the University EH&S contact for the laboratory and made available to the person who participated in the exposure monitoring.

2.8.3.1 Staff Exposure Determination

- **Initial monitoring** will be performed if there is reason to believe that those exposure levels for a substance could routinely exceed the action level (or permissible exposure limit [PEL] in the absence of an action level).

- **Periodic monitoring** will be performed if the initial monitoring performed discloses employee exposure over the action level (or PEL in the absence of an action level). The employee’s institution shall immediately comply with the exposure monitoring provisions of the relevant standard.

- Monitoring may be terminated in accordance with the relevant standard.
• Within 15 working days after the receipt of any monitoring results, the employees will be notified in writing of these results either individually or by posting the results in an appropriate location accessible to employees.

Anyone with a reason to believe that exposure levels for a substance routinely exceed the action level, or PEL in the absence of an action level, may request that the University EH&S Office initiate the monitoring process.

It will be the responsibility of the CHO to ensure that periodic monitoring requirements are satisfied, when necessary.

The University EH&S Office and the CHO will maintain records in accordance with the record-keeping requirements of OSHA 29 CFR 1910.1450.

Individual hospitals shall establish and maintain, for each employee, an accurate record of any measurements taken to monitor employee exposures and any medical consultation and/or examinations including tests or written opinions required by this standard. The individual hospitals shall ensure that such records are kept, transferred, and made available in accordance with OSHA 29 CFR 1910.20.

Records from monitoring done by other qualified services must be maintained by the CHO and the University EH&S Office.

2.8.3.2 Medical Surveillance
Medical consultations/examinations are coordinated for the University staff through the Employee’s Occupational/Employee Health Services and the University EH&S Office under the following circumstances:

• Whenever a staff member develops signs or symptoms potentially associated with a hazardous chemical to which the staff member may have been exposed in the laboratory.

• Where exposure monitoring reveals an exposure level routinely above OSHA’s action level or permissible exposure limit for an OSHA-regulated substance requiring such medical monitoring and medical surveillance.
• Whenever an event occurs, such as a chemical spill, leak, or explosion that results in the likelihood of a hazardous exposure. First aid issues are handled by the Employee’s Occupational/Employee Health Services during business hours or through the Emergency Room during off-hours.

• Whenever a staff member is exposed to blood or visibly bloody fluids by a needle-stick, open cut, or splash to the face.

2.8.3.3 Exposure Reporting
Staff who believe they have had an exposure should contact the CHO or the University EH&S Office for evaluation.

If employees exhibit adverse health effects, they should report immediately to the Employee’s Occupational/Employee Health Services or the Emergency Room. The University EH&S Office will evaluate the situation and conduct air sampling, if necessary, to determine actual exposures. The results of all hazard evaluations and any air sampling data will be available to all occupants of the affected areas. The CHO or the University EH&S Office can be contacted directly for information. In addition, the results of any personal air sampling will be given to the individual and kept on file in the Howard University EH&S Office.

2.8.4 Oversight, Annual Review, Recordkeeping, Compliance and Enforcement

The CHO is responsible for establishing and maintaining records for employee training, employee and environmental monitoring, and quantity of chemicals stored in the workplace. In practice, the CHO may designate another individual to assist with this work.

The Principal Investigator enforces the CHP by making sure that the chemical hygiene rules are known and followed. The CHO advises and assists in this work and helps with documentation.

The University EH&S Office will assist with chemical hygiene and housekeeping inspections. When there are significant changes in existing policies or work practices, an inspection will be conducted soon after the new process is implemented.
2.8.5 Identification and Classification of Hazardous Chemicals

All laboratories must submit an inventory of their hazardous chemicals to the Department Chair on an annual basis as part of the Emergency Signage (National Fire Protection Association [NFPA] Diamond) program. Based on these lists, the Howard University EH&S Office provides laboratory contacts with electronic copies of their laboratory’s appropriately labeled NFPA Diamonds for placement at entrance doors into the laboratories.

Hazardous chemicals can be classified into various categories (e.g., corrosive, reactive, flammable, toxic, etc.) and are labeled on the primary container as such. The definitions associated with these categories can be found at the following link:

Alternate means of classifying and identifying hazardous chemicals include the following:

- Lists of known or suspect human carcinogens, prepared by the International Agency for Research on Cancer and the National Toxicology Program, are available through the National Toxicology Program’s website:
  http://ntp.niehs.nih.gov/?objectid=72016262-BDB7-CEBA-FA60E922B18C2540

- SDSs are available by contacting the manufacturer. Laboratories should maintain a complete file of SDSs for chemicals used in the area. Each person working in the laboratory must be familiar with the SDSs for chemicals used in the area prior to working in the area.

- When the human or animal median lethal dose ($LD_{50}$) for any given substance is less than 50 milligrams per kilogram (mg/kg) or if the PEL is less than 10 parts per million (ppm), and if the substance is not on the list inthen the CHO and PI or Department Administrator or designee will have to develop a specific standard operating procedure for this chemical.

- Manufacturers and manufacturers’ associations have valuable information. See for a list of Chemical Information Resources.
2.8.6 Selection of Required Control Methods and Authority for Chemical Use

SDSs for many chemicals used in the laboratories indicate recommended limits (e.g., threshold limit value or TLV), OSHA-mandated limits (e.g., PEL, short-term exposure limit, and action limit), or both, as exposure guidelines.

When such limits are stated, they will be used in the laboratories by the CHO and the University EH&S Office staff to assist in determining the safety precautions and control measures necessary when handling toxic materials.

A chemical fume hood certified by the University EH&S Office must be used when the following occurs:
- When working with a compound that has a reported TLV or PEL less than 50 ppm.
- If the LD$_{50}$ is less than 500 mg/kg or the median inhalation dose, LC$_{50}$, is less than 200 ppm.$^1$
- When working with or handling toxic or malodorous materials (e.g., 2-mercaptoethanol) with moderate or high vapor pressure.

2.8.7 Special Provisions for Particularly Hazardous Substances (Carcinogens, Reproductive Toxins, and Acutely and Extremely Toxic Chemicals)

The procedures described in this section must be followed when performing laboratory work with greater than 10 milligrams (mg) of any carcinogen, reproductive toxin, substance with a high degree of acute toxicity, or chemical whose toxic properties are unknown.

These substances must be handled, used and stored only in designated areas of restricted access. Appropriate areas include chemical fume hoods, glove boxes, designated portions of a laboratory, or an entire laboratory if it is specifically dedicated for that purpose.$^2$ A designated area must be clearly posted with signs warning that a specific, extremely hazardous material is in use and that only those trained to work with it are

---

$^1$ These values should be used if a TLV or PEL is not available for the substance in question.

$^2$ A designated area may be posted with a removable sign if work with extremely hazardous agents is not continuous in the laboratory.
allowed to enter the area while procedures using it are ongoing. The boundaries of the designated area must be clearly defined.

The smallest amount of a chemical that is required by a procedure should be used, purchased, and stored. Whenever possible, material should be ordered in amounts equal to that required in a given procedure to avoid unnecessary weighing out of the material.

Spill procedures must be developed and posted in the designated area. Staff should be familiar with and have available materials that will inactivate the chemical.

Long-sleeved clothing and gloves known to be impermeable to the material must be worn whenever working in designated areas. Because decontamination of jewelry may be difficult, it is recommended that jewelry not be worn when working in a designated area.

The designated area must be decontaminated when work is completed. Contact the University EH&S Office for more information.

Liquid wastes must be put into screw-top containers that are compatible with the chemical. The container must be labeled with the words, *Hazardous Waste*, the chemical name, the type of hazard (toxic, ignitable, corrosive, or reactive), and dated only when full. Hazardous waste labels are available from the University EH&S Office. Hazardous waste must be removed from the lab within three days after filling the container.

### 2.8.8 Elimination or Substitution

The first step in evaluating the safety of a new experiment, process, or operation is to investigate the possibility of eliminating hazardous materials or substituting with a less hazardous material.\(^3\) When selecting alternate products, care must be taken that one hazard is not being substituted for another.

---

\(^3\) As an example, instead of using an organic solvent or chromic acid-based material for washing glassware, one should substitute an aqueous-based detergent. Aromatic compounds (i.e., benzene) and chlorinated hydrocarbons (i.e., methylene chloride) in some experiments should be replaced with aliphatic compounds or non-chlorinated hydrocarbons.
The particular process, experiment, or operation may also be modified to reduce the quantity of the hazardous material(s) necessary or limit the potential emission release rate or exposure time. The use of a secondary containment device, such as a pan, can also be helpful in preventing or minimizing the effects of chemical spills. The University EH&S Office should be consulted for advice at [add client contact information]

2.8.9 Enclosure, Isolation and Regulated Areas

Reducing the potential for exposure to particularly hazardous chemicals is achieved by restricting the use of the material to a designated area equipped with the proper control devices. This designated area can be a glove box, fume hood, bench, or an entire laboratory depending on the manipulations required. Hazardous substances are stored, used, and prepared for disposal only in designated areas. The designated area is identified by signs to alert others of the presence of a particularly hazardous material. For example:

Over balance area: **CAUTION: ACRYLAMIDE BALANCE**

On glove box: **CAUTION: AFLATOXIN IN USE**

Radiation signs are available from the Radiation Safety Office at (202) 806-7216 [information]. Biohazard signs are available from the Biosafety Officer at (202) 806-9710.

In addition to establishing the physical boundaries that define the designated area, procedures used in a designated area have special provisions. These include storage, use of protective equipment, containment, equipment disposal, and decontamination procedures.

---

For example, the use of micro scale techniques may be applicable in measuring boiling points of a material. Another example is the substitution of closed systems for open vessels.
2.8.10 General Work Practices and Standard Operating Procedures for Chemicals or Classes of Chemicals

Before developing general work practices and standard operating procedures, it is important to consult the SDS for the chemical. The following are general guidelines for responding to an incident.

2.8.10.1 General Work Practices—Spills

- **Eye Contact**: Eyes should be promptly flushed with water for 15 minutes. Medical help should be sought immediately after flushing.

- **Skin Contact**: Contaminated clothing should be removed as quickly as possible and the affected area flushed with water for 15 minutes. Medical attention should be sought immediately after flushing.

- **Clean up with no injury**: If no one is injured, the cleanup of the spill should begin immediately. For assistance or advice, call EH&S at (202) 806-1033.

- **Clean up with injury**: If someone is injured, that person should seek medical assistance immediately. Clean up should be initiated by someone other than the injured person. For assistance or advice, call EH&S at (202) 806-1033.

2.8.10.2 General Work Practices—Avoidance of Routine Exposure

- Work should be conducted in a chemical fume hood whenever possible.

- Smelling chemicals to determine their identity should be avoided.

- **Never** place your head inside of a chemical fume hood to check on an experiment.

- Inspect gloves before use.\(^5\)

- Release of toxic chemicals (including dry ice) in cold or warm rooms must be avoided, these rooms contain recirculated atmospheres.

- Exhaust of an apparatus (e.g., vacuum pumps) that may discharge toxic chemicals should be vented into a fume hood or filter.

- When transporting hazardous chemicals, use one or more of the following:
  - Carts designed to prevent bottles from spilling;
  - Secondary containment; or

---

\(^5\) Up to 5% of all new and unused gloves have holes or tears in them.
− Bottle carriers.

2.8.10.3 General Work Practices—Choice of Chemicals

• Less toxic substances should be substituted in place of more toxic ones wherever possible.
• Only those amounts necessary for immediate work should be ordered.

2.8.10.4 General Work Practices—Personal Hygiene

• No eating (including chewing gum), drinking, smoking, or applying cosmetics is allowed. The use of contact lenses in the laboratory should be avoided.
• Mouth pipetting of any substance is prohibited.
• Hands must always be washed before leaving the laboratory. Solvents must never be used to wash hands.
• Laboratory coats and safety glasses should be worn in the laboratory whenever there is a potential for exposure to infectious, chemical, or radioactive hazards. Appropriate gloves must be worn when handling chemicals. “Effective Use of Gloves.” This equipment should not be worn in cafeterias, bathrooms, and conference areas to avoid cross contamination.

2.8.10.5 General Work Practices—Appropriate Storage of Chemicals

• Incompatible chemicals must be segregated
• Glass bottles must not be stored on high shelves or on the floor.
• Chemicals should be stored in containers with which they are compatible.
• All bottles must be labeled with the correct chemical name in English and using no abbreviations. Bottles should be dated upon receipt and again upon opening.

2.8.10.6 General Work Practices—Procedures for Flammable Chemicals

• General Use and Handling
  − Flammable liquids are defined as those liquids with a flash point of 140 degrees Fahrenheit (°F) or less and having an absolute vapor pressure of not more than 40
pounds per square inch at 100 °F. Some examples commonly found at the University are acetone, methanol, ethanol, ether, and xylene. All flammable liquids should be handled carefully.

- Flammable substances should be handled only in areas free of ignition sources (e.g., away from electric ovens, burner flames, and hot surfaces).

- Flammable substances should never be heated using an open flame. Heating mantles, oil baths, safety hot plates, and steam baths should be used. When heating either by steam bath or hot plate, use a filter or distilling flask as a receiver. Such distillations must be carried out in a fume hood.

- Smoking is not permitted at the University.

- Boiling chips or glass beads are helpful in distilling or evaporating flammable substances to prevent superheating and bumping.

- Ground cylinders or equipment when transferring flammables from one container to another. Contact the EH&S department, if there are questions about proper grounding.

- **Storage**

  - Bottles of volatile liquids should not be stored near heat sources or in direct sunlight.

  - Quantities of flammable solvents stored in the laboratory should be kept to a minimum. The Fire Department limits storage based on the type of liquid, the floor, where the solvents are stored, and the size of the laboratory (control area). Contact the University EH&S Office at (202) 806-0133 regarding the limit for your control area. Whenever possible, flammable liquids including spray and squeeze bottles should be stored in approved storage cabinets. Flammable liquids must never be stored on the floor.

  - Adequate ventilation must be provided where flammable liquids are used.

  - When flammable liquids are stored in a refrigerator, it must be a *Laboratory-Safe Refrigerator* (as defined in NFPA 45). These are approved for storing flammable liquids and have all electrical equipment mounted on the outside surface of the refrigerator.
- Flammable liquids must not be stored with chemicals that are considered to be incompatible with them (e.g., oxidizers, oxidizing acids, etc.).

2.8.10.7 General Work Practices—Procedures for Reactive Chemicals

Reactive materials include oxidizers, organic peroxides, explosives, air sensitive, shock sensitive, temperature sensitive, and those ranked 3 or 4 for instability by the NFPA. These materials are known as unstable materials. Each laboratory is responsible for disposing of unstable materials prior to them becoming potentially explosive.

For peroxide-forming chemicals (e.g., ethyl and isopropyl alcohol ethers, tetrahydrofuran), containers should be dated upon opening and disposed of as hazardous waste by the expiration date or within six months, whichever is sooner.

All reactive materials must be handled with caution, personal protective equipment must be used, and, where possible, work should be done in a chemical fume hood.

2.8.10.8 General Work Practices—Procedures for Corrosive Chemicals

- Extreme care must be exercised in handling and pouring corrosive materials. This includes: approved gloves, a laboratory coat, and safety glasses.

- Acids and similar chemicals should not be stored above laboratory bench level.

- Corrosive materials should not be heated or handled in large, fragile containers (e.g., four-liter beakers) without providing a secondary containment to catch the contents in case of breakage.

- Porcelain dishes should not be used as cleaning baths.

- Strong alkalis should not be stored next to strong acids.

- Inorganic acids and organic acids should be segregated from each other.

- If strong acids or alkalis come in contact with skin or clothing, affected parts should be washed quickly and thoroughly with large quantities of water. If such materials are
splashed in the eyes, they should be flushed thoroughly with a continuous stream of cold water for at least 15 minutes. In either case, medical attention should be sought immediately.

2.8.10.9 Special Procedures: Work with Formaldehyde

OSHA’s formaldehyde standard, *Occupational Exposure to Formaldehyde*, 29 CFR 1910.1048 states that the eight-hour PEL time-weighted average for people working with formaldehyde is 0.75 ppm. The short-term exposure limit (STEL) time-weighted average for 15-minute exposure is 2.0 ppm.

The Hazard Warning for formaldehyde, including labeling requirements, falls under the OSHA *Hazard Communication Standard*. If formaldehyde is to be used by any individual in the laboratory, all staff should be informed of the health hazards of formaldehyde upon initial orientation to the work site.

2.8.11 Personal Protective Equipment

Personal protective equipment (PPE) is designed to prevent personal injury. Examples of PPE include safety glasses or goggles, face shields, safety shields, gloves, rubber aprons, laboratory coats, and protective creams. It is the responsibility of the Department Administrator and/or PI to ensure that laboratory staff is using necessary safety equipment.

The type and level of equipment can be determined with the aid of the CHO and the University EH&S Office. Use of PPE should only be considered after exercising all options for reducing the hazards. If in doubt about the potential danger of an experiment or activity, all available safety devices should be employed. Information on such devices can be obtained from the Howard University EH&S Office upon request.

2.8.11.1 Respirators

Required use of a respirator is the responsibility of the Department Administrator, the PI (or their designee), the CHO, and the University EH&S Office. The Howard University respirator policy must be followed when respiratory protection is required. All staff must follow these elements.
• Less hazardous materials should be substituted for more hazardous materials.

• Laboratory fume hoods or other engineering controls should be employed to control exposure.

• If items 1 and 2 above have been considered but added protection is still deemed necessary, respirator type shall be selected on the basis of type of chemical exposure, level of exposure, and user medical examination.

• Selection of a respirator type must be performed in consultation with the University EH&S Office.

• A medical clearance is required for each employee before a respirator is used routinely. A medical clearance can be obtained through the University’s Occupational/Employee Health Services.

• Appropriate fit testing and training shall be performed under the direction of the institution for all negative pressure respirators before use. [Need client information]

• The respirator user must regularly maintain and clean reusable respirators.

• The respirator user must perform a negative and positive pressure check before each use.

2.8.11.2 Eye Protection
At minimum, ANSI-approved safety glasses and/or goggles are required to be worn when working with any hazardous materials, or when there is a risk of splashing, irritating mists, vapors, fumes, or flying projectiles.

Ordinary prescription glasses are not designed to provide adequate protection against occupational hazards. Prescription safety glasses are recommended for employees who must routinely wear safety glasses in lieu of fitting safety glasses over their personal glasses.
Safety Goggles

Safety goggles will provide a greater degree of protection than safety glasses by providing a tighter fit against the face. Safety goggles or face shields should be worn whenever there is an elevated risk of a chemical splash or flying projectiles, or when working with volatile substances that irritate the eyes (e.g., chlorine, strong ammonia, irritating dusts).

Face Shield

When working with a corrosive liquid, dispensing liquefied nitrogen, or where otherwise appropriate, a face shield should also be worn to protect the chin, neck, face, and ears. Face shields will supply added protection from flying particles and liquid splash. To gain maximum protection against chemical splash, a face shield should be used in conjunction with safety glasses.

Note: Contact Lenses

Wearing of contact lenses is discouraged when working with hazardous materials. Persons who wear contact lenses are at greater risk for prolonged exposure and potentially permanent eye injury in the event of a chemical splash, since some chemicals can be absorbed into the contact lens and make it harder to remove. Using contaminated fingers to remove contacts in a stressful splash situation represents further exposure risk. If contact lenses are worn when working with hazardous materials, safety glasses (at a minimum) must be worn to protect the eyes, and safety goggles are encouraged.

2.8.11.3 Protective Clothing

The use of protective clothing, including gloves, shall be determined by the University EH&S Office. When working with a potential hazardous material, protective clothing is required.

- Protective clothing is chosen, with the aid of the University EH&S Office, on the basis of the chemical exposure and medical condition of the user.
- Contaminated protective clothing must be disposed of properly.
- Open-toed shoes or sandals shall not be worn in the laboratory.
- Skin should not be exposed when working with hazardous materials.
- Contaminated laboratory coats shall not be worn.
NOTE: Laboratory coats should not be worn in common areas
(Cafeterias, bathrooms, kitchen areas, outside, conference rooms, break rooms, etc.)

2.8.11.4 Protective Gloves
When handling toxic or hazardous chemicals, protective gloves are required. To protect
against accidental spills or contamination, workers should refer to glove manufacturers’
glove charts to select a glove appropriate for use with the reagent in question. There is no
glove currently available that will protect against all chemicals for all types of tasks. If the
gloves become contaminated, they should be removed and discarded as hazardous waste
as soon as possible.

Staff members must remove at least one glove before leaving the immediate work site to
prevent contamination of public areas (e.g., doorknobs, light switches, telephones, etc.).

Latex Alert: Latex (i.e., several protein antigens) has been shown to be a sensitizer. In
order to best protect workers from becoming sensitized, powdered latex exam gloves are
PROHIBITED in the University laboratories. Powder-free latex gloves may be used where
appropriate.

NOTE: Latex gloves do not protect against every hazardous material.

2.8.11.5 Other Personal Protective Equipment
Other personal protective equipment shall be used as needed.

Safety shields are recommended for use whenever solvent or vacuum distillations are
being run in glass equipment or whenever large glass vessels are subjected to a vacuum.
Safety shields should also be used during reactions involving unknown characteristics or
that contain toxic or radioactive materials (e.g., high-energy emitters such as $^{125}$I or $^{32}$P).

2.8.12 Ventilation, Fume Hoods and Proper Operations
Local exhaust ventilation is the primary method used to control inhalation exposures to
hazardous substances. Other types of local exhaust include vented enclosures for large
pieces of equipment or chemical storage and snorkel types of exhaust for capturing contaminants near the point of release.

A laboratory fume hood should be used when working with hazardous substances. A properly operating and correctly used fume hood will control the vapors released from volatile liquids, as well as unpropelled dusts and mists.

Do not make any modifications to hoods or ductwork without first calling the University EH&S Office at (202) 806-0133.

A fume hood should not be used for large pieces of equipment unless the fume hood will be dedicated for this use since it will change airflow patterns and render the fume hood unsafe for other uses. It is generally more effective to install a specially designed enclosure for large equipment so that the hood can be used for its intended purpose.

A fume hood should not be used for chemical or other miscellaneous storage, this also restricts airflow. Chemicals should be stored in a sealed (following NFPA 45 requirements) chemical storage cabinet. All freestanding cabinets should have bungs in place and the doors should close properly.

Before you begin using a fume hood, check to see that the hood is labeled appropriately for use with toxic chemicals and has been certified within the last year. If a fume hood requires certification or if you have questions regarding fume hood operation, contact the University EH&S Office at (202) 806-0133.

Some of the basic guidelines for working safely in a chemical fume hood include the following:

1. Work at least six inches behind the sash.
2. If it is necessary to store materials in a fume hood, they should be elevated so that air can pass under them.
3. Never put your head (or face) inside an operating fume hood to check on an experiment.
4. Work with the sash in the lowest position possible. The sash will act as a barrier and provide containment should a problem arise with the reaction.
5. Do not clutter the hood with bottles or equipment. Only materials actively in use should be in the fume hood.

6. Clean the grille along the bottom slot of the back of hood regularly so it does not become clogged with paper and dirt.

7. Do not dismantle or modify the physical structure of the hood or exhaust system in any way without first consulting the University EH&S Office.

8. Report any suspected hood malfunctions to the University EH&S Office. 2.8.13

Housekeeping

It is essential for both safety and efficiency that the facilities be kept neat and orderly. Floors, shelves, and benches should be free from dirt and unnecessary apparatus and tools. Equipment should never obstruct exits, passages, or fire extinguishers, etc.

Care should be exercised when disposing of materials. Flammable or toxic materials should be collected for disposal as hazardous waste and, therefore, should not be placed in the regular waste stream.

General guidelines for good housekeeping include the following:

1. Never block access to emergency equipment, showers, eyewashes, and exits.
2. Label all chemical containers with the identity of the contents and list the appropriate hazards.
3. All work areas should be kept clear of clutter.
4. All aisles, hallways, and stairs must be kept clear.
5. All chemicals should be returned to their proper storage area at the end of the day.
6. Liquid wastes should be kept in spill-proof containers and stored off the floor in an appropriate storage area.
7. ALWAYS BE PREPARED FOR SPILLS. Small spills should be cleaned up promptly using the spill kits located in the laboratory. All clean up materials must be collected for disposal as hazardous waste.
2.8.14 Signs and Labels and Material Safety Data Sheets

2.8.14.1 Emergency Signage

The Fire Department requires that each laboratory have appropriate signage to indicate the level of the hazard with respect to the chemicals stored in the laboratory. This signage takes the form of a diamond (NFPA 704 diamond), which is comprised of four smaller diamonds. Each smaller diamond is color-coded to represent a specific hazard classification: blue for health hazards, red for flammability hazards, yellow for reactivity hazards, and white for special classes of hazards. For more information on NFPA diamonds, refer to Appendix A.

Each small diamond contains a number from 0 to 4. A hazard level of 0 on the NFPA diamond represents no hazard while a hazard level of 4 on the NFPA diamond represents the highest hazard in that category. Fires and other emergencies may be dealt with more effectively and safely if the emergency responders are informed of the level of hazards in a specific area. The names and emergency phone numbers of the current Department Administrator or PI responsible for each laboratory area, including shared spaces, should also be posted. Laboratories are responsible for keeping their contact information current.

Signs are inspected annually by the University EH&S Office and are based upon the chemical inventories received from the laboratories. It is extremely important that contact names and chemicals are kept current. The Fire Department may choose not to enter a laboratory if the information provided appears to be out-of-date.

2.8.14.2 Other Signs

1. Radioactive or biohazardous substances used in laboratories require the posting of special signs.

2. *Eye Protection Required* signs are recommended at entrances to laboratories using acids and corrosive chemicals. Safety glasses for visitors must be provided.

3. Signs indicating the location of fire blankets, eyewash units, safety showers, fire extinguishers, and other safety devices are required.
4. Entrances to laboratories, storage areas, and associated facilities must have signs as necessary to warn emergency personnel and custodians of unusual or severe hazards.6

2.8.14.3 Chemical Container Labeling

All containers must be labeled with the chemical contents. The labels must be in English and have no abbreviations on them. Chemicals received from outside vendors or from internal stockrooms must have labels indicating the name, along with other physical and chemical data. Toxicity warning signs or symbols should be prominently visible on the labels.

All chemical containers that have been decanted from an original container must be labeled with the chemical name, the primary hazard(s), the name of the responsible person, their PI, and the date. The University EH&S Office can be contacted for further information regarding labels for this purpose.

All chemical waste containers must be labeled with the words Hazardous Waste, the full chemical name(s), the type of hazard (i.e., toxic, ignitable, corrosive, or reactive), the responsible person, and the date the container became full. Labels are available from the University EH&S Office. Labeling must be provided for chemicals synthesized in the laboratory or prepared by other processes, such as distillation or extraction. For information about obtaining hazard labels, please contact the University EH&S Office.

Chemicals developed in the laboratory must be assumed to be toxic if no data on toxicity are available. Suitable handling procedures must be prepared and implemented, including training of users in controls necessary to handle a material safely. If the substance is produced for another user outside of the laboratory, a SDS and labels must be prepared and provided to such users in accordance with the OSHA Hazard Communication standard 29 CFR 1910.1200.

For information on the labeling of biohazardous materials, as required by the OSHA Bloodborne Pathogen standard 29 CFR 1910.1030.,

---

6 Examples of severe or unusual hazards that may require signs are unstable chemicals, toxic or carcinogenic materials, water reactive chemicals, and radioactive materials.
2.8.14.4 Safety Data Sheets

SDSs are bulletins prepared by manufacturers to summarize the health and safety information associated with their products. The manufacturer or supplier should provide SDSs for each chemical. A complete file of SDSs should be maintained in the laboratory and must be accessible to any staff member or visiting professional. More information can be obtained from SDS link below:

https://msdsmanagement.msdsonline.com/6455dc57-8e3e-4904-bd68-84e978899bf8/ebinder/?nas=True

The 16 information required by OSHA in SDS in the following order is given below:

1. Identification
2. Hazard(s) identification
3. Composition/information on ingredients
4. First-aid measures
5. Fire-fighting measures
6. Accident release measures
7. Handling and storage
8. Exposure controls/personal protection
9. Physical and chemical properties
10. Stability and reactivity
11. Toxicological information
12. Ecological information
13. Disposal considerations
14. Transport information
15. Regulatory information
16. Other information

A user's guide to SDSs can be found in. Consult with the University EH&S Office to apply this general information to your work situation.
2.8.15 Waste Disposal

Every effort should be made to dispose of hazardous waste in a proper, safe, and efficient manner. It is the responsibility of the individual creating the waste to properly identify and handle waste chemicals within the University facility.

The University EH&S Office maintains a “Main Accumulation Area” for the storage of chemical hazardous wastes transported from the laboratories.

Each Department maintains Satellite Accumulation Areas (SAAs) in the laboratories for the storage of chemical hazardous waste. The following guidelines must be followed at all SAAs.

- Once a waste container has been filled in the laboratory, it must be transported out of the laboratory to the main accumulation area and/or directly off-site through the hazardous waste vendor for disposal within three days.
- Waste chemicals stored in containers of one gallon or larger sizes shall be **break-resistant** whenever possible.
- Waste chemicals stored in breakable containers of one gallon or larger sizes shall be kept in approved secondary containers.

  - Break-resistant shall mean a container made of metal, plastic, plastic-coated glass or metal overpacks of glass.
  
  - An approved secondary container is a bottle carrier made of rubber, metal, or plastic with carrying handle(s) which is of large enough volume to hold the contents of the chemical container. Rubber or plastic should be used for acids/alkalines, and metal, rubber, or plastic for organic solvents.

- Wastes must be packaged and placed in containers in a manner that will allow them to be transported without the danger of spillage, explosion, or hazardous vapors escaping. Wastes that have not been properly packaged and identified will not be accepted for disposal.
2.8.15.1 Unknown Waste Chemicals

Every effort should be made by the Department Administrator or PI to identify unknown waste. It is the responsibility of the department to identify all chemicals. The Department Administrator or PI may need to question laboratory personnel, students, and volunteers, or send a sample to an analytical laboratory, to ascertain the contents of unknown wastes. All charges associated with the identification of an unknown waste will be paid by the laboratory/department. Laboratory personnel must be constantly reminded to identify and label all wastes and project products. If unknown waste has been discovered and cannot be identified, immediately contact the University EH&S Office.

NOTE: Never mark a container “UNKNOWN.”
Label unknown waste streams with the words “Pending Analysis.”

2.8.15.2 Transportation

All hazardous waste will be collected from the laboratories and transported to the Main Accumulation Area by a representative of the Howard University EH&S office.

2.8.15.3 Guidelines for Waste Reduction/Management

Procedures for waste disposal should be prepared before beginning a project. Waste must be labeled properly. Each department, group, or researcher must properly identify waste materials prior to disposal; inadvertent mixing of incompatible materials could have serious consequences.

Waste minimization is very important to protect the environment and also to reduce the disposal costs charged to the laboratory. The following suggestions should be considered in an effort to minimize the amount of waste generated by the laboratory.

- Order only and store the amount of material needed for the project or experiment.
- Use only the amount of material that is needed for conclusive results.
- Date containers upon receipt and again upon initial opening.
- Before disposing of unwanted, unopened, or uncontaminated chemicals, check with others at Howard University who may be able to use them using the ChemShare Inventory program.
On termination of a research project, all unused chemicals to be kept by the laboratory shall be labeled and dated. All chemicals for disposal must be in proper containers and labeled with the words *Hazardous Waste*, the chemical name, type of hazard (toxic, ignitable, corrosive, or reactive), and the date.

2.8.15.4 Types of Chemicals and their Disposal

Regulations prohibit the discharge of most organic solvents into the sewer system. Small amounts of water-soluble, non-flammable materials may be discharged down the drain. The University EH&S Office must be consulted to determine which chemicals can be disposed in this manner.
**Table 2.1** Types of Chemicals and Their Disposal

<table>
<thead>
<tr>
<th>Chemical Class</th>
<th>Disposal</th>
</tr>
</thead>
<tbody>
<tr>
<td>Organic solvents</td>
<td>• Packed in suitable containers that prevent vapors or liquids from escaping.</td>
</tr>
<tr>
<td></td>
<td>• Tightly cap</td>
</tr>
<tr>
<td></td>
<td>• Prominently label containers</td>
</tr>
<tr>
<td></td>
<td>• Disposed as hazardous waste</td>
</tr>
<tr>
<td>Mixtures of organic solvents</td>
<td>• If compatible they can be combined in one container</td>
</tr>
<tr>
<td></td>
<td>• Container must have estimated percentages of each solvent in the mixture.</td>
</tr>
<tr>
<td>Ether (di-ethyl) in cans</td>
<td>• Do not move if over a year beyond the expiration date or beyond six months from the date of opening</td>
</tr>
<tr>
<td></td>
<td>• The Howard University EH&amp;S Office must be contacted immediately.</td>
</tr>
<tr>
<td>Acids and alkaline solutions</td>
<td>• Concentrated acids and caustics must be treated as hazardous waste</td>
</tr>
<tr>
<td></td>
<td>• Store in tightly capped and labeled containers</td>
</tr>
<tr>
<td>Inorganic and organic solids</td>
<td>• If in original containers may be sent to the Howard University hazardous waste room.</td>
</tr>
<tr>
<td>Mercury</td>
<td>• Contact Howard University EH&amp;S Office to dispose of mercury containing equipment.</td>
</tr>
<tr>
<td></td>
<td>• Put broken mercury thermometers into a jar or secondary container.</td>
</tr>
<tr>
<td></td>
<td>• Clean-up materials from a mercury spill may be placed in a container, labeled, and sent to the hazardous waste accumulation area.</td>
</tr>
<tr>
<td></td>
<td>• Mercury-containing compounds must be disposed through the hazardous waste room.</td>
</tr>
<tr>
<td>Cyanide compounds, arsenic, lead, and heavy metal wastes</td>
<td>• Place in bottles or containers</td>
</tr>
<tr>
<td></td>
<td>• Seal tightly</td>
</tr>
<tr>
<td></td>
<td>• Label, and place in the hazardous waste accumulation area.</td>
</tr>
<tr>
<td>Alkali metals (e.g., sodium and potassium)</td>
<td>• Place in a suitable container</td>
</tr>
<tr>
<td></td>
<td>• Cover with Nujol® (mineral oil)</td>
</tr>
<tr>
<td></td>
<td>• Label properly, seal and dispose as hazardous waste</td>
</tr>
<tr>
<td>Pyrophoric metals (e.g., magnesium, strontium, thorium, zirconium, and other pyrophoric chips and fine powders)</td>
<td>• Place in a metal container</td>
</tr>
<tr>
<td></td>
<td>• Seal tightly</td>
</tr>
<tr>
<td></td>
<td>• Label, and send out as hazardous waste</td>
</tr>
<tr>
<td>Waste oil (e.g., vacuum pump oil or lubricating oils)</td>
<td>• Collect in one-gallon containers or less</td>
</tr>
<tr>
<td></td>
<td>• Dispose of as hazardous waste</td>
</tr>
</tbody>
</table>

The University EH&S Office may be consulted if there is any question concerning the toxicity or packaging of any toxic wastes.
2.8.15.5 Other Types of Wastes—Special Procedures Required

- **Compressed gas cylinders** are to be returned to the proper vendor. Some small lecture bottles are of the non-returnable type and become a disposal problem when empty or near empty with a residual amount of gas. When ordering gases in lecture bottle size, be sure to order the gases in a returnable cylinder.

- **Controlled drugs** to be disposed of as waste must not be sent to the waste accumulation area. The handling, records, and disposal of controlled drugs are the responsibility of the department and must be conducted within Drug Enforcement Agency regulations.

- **Radioactive material** disposal is handled in accordance with procedures established by Radiation Safety. Contact Radiation Safety Officer at (202) 806-7216.

- **Biological waste and physically dangerous waste (sharps)** must be placed in proper containers. Contact the University EH&S Office at (202) 806-0133 for proper disposal procedures.

- **Polychlorinated biphenyls** found in capacitors, transformers, equipment, and oil is the responsibility of the department. Information on possible disposal contractors can be obtained by calling the University EH&S Office.

2.8.16 Emergency Situations

Emergencies that may occur in a laboratory include fire, explosion, chemical spill or release, or medical or other health threatening accidents. General procedures to be followed in any emergency are the following.

1. Assist person(s) involved. Remove person(s) from exposure to further injury or a life-threatening situation, if it can be done safely.
2. Notify nearby persons who may be affected and call the University EH&S Office to report the emergency and seek assistance.
3. Evacuate the area until help arrives.
4. Wait for emergency responders and assist them in handling the emergency.
5. Assist in the follow-up investigation of the emergency.
For specific emergencies that may occur in the laboratory space (i.e., chemical spills, fire, explosion, etc.), refer to the specific procedures established by the laboratory.

2.8.17 Emergency Equipment

In any emergency, it is critical that all staff members are familiar with the use and location of emergency equipment. These include fire extinguishers, fire alarms, safety showers, and eyewash stations.

All emergency equipment is on a preventive maintenance schedule. Fire alarms are tested periodically and extinguishers are inspected monthly by the building management entity. Safety showers on a quarterly basis and eyewash stations on a monthly basis are tested by the University EH&S Office.

2.9 HAZARD COMMUNICATION

2.9.1 General Information

In order to comply with the OSHA Standard 29 CFR 1910.1200, Hazard Communication, the following written Hazard Communication (HAZCOM) Program is established for the University. This program applies to all work operations in this facility where employees may be exposed to hazardous substances during normal working conditions or during an emergency situation. This written program may be obtained from the University EH&S Office at [need contact information]. Under this program employees will be informed of the contents of the OSHA Hazard Communication Standard, the hazardous properties of the chemicals and materials with which they work, the safe handling procedures, and measures to take to protect themselves from these chemicals.

The PIs and Laboratory or Department Administrators are ultimately responsible for ensuring that all applicable provisions and components of the HAZCOM Program are implemented as required within their respective departments. To this end, PIs and Laboratory or Department Administrators are encouraged to designate a person or persons to see to it that each of the program elements are being fully addressed (e.g., labeling, SDSs availability to employees, employee training and information, maintaining
a list of hazardous materials in the laboratory, informing employees of hazardous non-routine tasks, etc.).

The provisions of this program will apply in all situations involving the use of hazardous materials which are not otherwise included within the scope and coverage of the Chemical Hygiene Plan discussed in section 2.8. This HAZCOM Program applies to the laboratory areas within University.

### 2.9.2 Container Labeling

The laboratory safety contact will verify that all containers of hazardous chemicals received from manufacturers, distributors, or importers are clearly labeled to indicate:

- The identity of the contents. The identity of the contents must match the corresponding SDS.
- Appropriate hazard warnings, including routes of entry into the body and the target organs, if known.
- The name and address of the manufacturers, importer, or responsible party.

The laboratory safety contact will ensure that secondary containers are properly labeled when required. Chemicals that are transferred from a labeled container to a portable container for the immediate use by the person transferring the chemical do not require a label on the portable container. The University policy urges that all containers be labeled in English despite the intended period of use. The person in charge will assure that hazard warning labels on the containers are not removed or defaced unless the hazard is no longer present.

Secondary containers must be labeled with the name of the hazardous chemical (no abbreviations) and the hazard associated with the hazardous chemicals in English. Labels used for secondary containers may be copies of the original manufacturers’ labels or a facsimile. The following is an example of a label:

```
ETHANOL
FLAMMABLE
```
Laboratories with members, who speak other languages, may add the information in the non-English language as long as the information is presented in English as well for Emergency Response purposes.

2.9.3 Safety Data Sheets

The SDS is a detailed information bulletin prepared by the manufacturer or importer of a chemical product or chemical substance. It describes the chemical and physical hazards associated with the product or substance, its physical and chemical characteristics, when and how it may be hazardous, the effects of exposure, precautions for safe handling and use, emergency and first aid procedures, and control measures that are applicable.

Sometimes an SDS contains information that may not apply to your particular operation. In such cases, concentrate essentially on the information that is applicable to your situation. In general, employees should focus on the hazard information and what protective measures to take. Employers are required to maintain or make available to employees a complete and accurate SDS for each hazardous chemical that is used in the workplace.

OSHA has determined that drugs and medications that are not in solid or final form for direct administration to the patient fall within the scope of HAZCOM and, therefore, must be covered by SDSs. Accordingly, SDSs must be available for all drugs and medications that are liquid, gaseous, aerosol, etc., or not otherwise in solid, final form. SDSs for such products will be available from the EH&S office. SDSs for chemical products other than pharmaceuticals are available from the manufacturers or suppliers of the product and employers (users) are automatically entitled to this information upon purchase of the product.

Laboratory or Department Chairs will be responsible for obtaining and maintaining the SDSs for all hazardous materials in their laboratory inventory. When hazardous substances are received without an SDS and one is not available from a previous purchase, a letter with a copy to file should be sent to the supplier requesting the SDS. If the supplier fails to furnish the requested information, notify the University EH&S Office. PIs or Department Chairs will ensure that any and all incoming SDSs are reviewed for new and significant health/safety information and pass any such information on to the
affected employees. This may be done through delegation. Copies of SDSs for all toxic and hazardous substances that any person working at the University may be exposed to must be readily accessible to all areas where the substances are used, handled, or stored. SDSs will be available to all employees for their review during each work shift. An electronic version of the SDS may be used as long as each employee who used the hazardous material has access to electronic version of the SDS. If an SDS is not available for any particular chemical or product, employees should contact their supervisor.

For assistance with interpreting and applying the information contained in the SDS, contact the University EH&S Office. To obtain a SDS:

- Ask your Laboratory Administrator, Department Chair, or Principal Investigator for the location of the SDS file.
- Contact the manufacturer of the product.
- Access information online at https://msdsmanagement.msdsonline.com/6455dc57-8e3e-4904-bd68-84e978899bf8/ebinder/?nas=True
- Contact the EH&S Office.

2.9.4 Safety Data Sheet Checklist

Each SDS will be checked to ensure that the following information is covered:

- Product or chemical identity used on the label.
- Manufacturer’s name and address.
- Chemical and common names of each hazardous ingredient.
- Name, address, and phone numbers for hazard and emergency information.
- Preparation or revision date.
- Hazardous substances that comprise the product.
- The physical and chemical characteristics of the hazardous substances, such as vapor pressure and flash point.
- Physical hazards, including the potential for fire, explosion, and reactivity.
- Known health hazards, including signs and symptoms of exposure.
- OSHA PEL, American Conference of Governmental Industrial Hygienists (ACGIH) TLV or other exposure limits.
- Emergency and first aid procedures.
- Whether OSHA, National Toxicology Program (NTP), or International Agency for Research on Cancer (IARC) lists the ingredient as a carcinogen.
- Precautions for safe handling and use.
- Control measures such as engineering controls, work practices, hygienic practices, or personal protective equipment required.
- Primary routes of entry.
- Procedures for spills, leaks, and clean up.

2.9.5 Employee Training and Information

Under the OSHA HAZCOM Standard, employers are required to inform employees where hazardous chemicals and/or products, including pharmaceuticals, are present at the time of their initial assignment to a work area (i.e., the Howard University laboratory) as well as each time a new hazard is introduced into the work area.

PIs, Laboratory Administrators or Department Chairs are responsible for ensuring employees attend a HAZCOM training session, which is part of the initial/annual University EH&S training. Prior to starting work, each new employee will receive information and training on the following as appropriate with their respective jobs. Training will cover the following topics (at a minimum):

- Operations in their work area where hazardous chemicals, chemical products, or applicable pharmaceuticals are present.
- Location and availability of the written hazard communication program.
- Physical and health effects of the toxic or hazardous substances.
- Methods and observation techniques used to determine the presence or release of toxic and hazardous substances in the work area.
- How to use toxic and hazardous substances in the safest possible manner, including safe work practices and personal protective equipment requirements.
• Steps that University has taken to lessen or prevent exposure to toxic and hazardous substances.
• Emergency procedures to follow, if exposed to these toxic and hazardous substances.
• How to read labels and review SDSs to obtain appropriate hazard information.
• Location of SDS file and location of toxic and hazardous substances list.

For more information regarding the Howard University EH&S training program, please contact the University EH&S Office at [need information from client]

2.9.6 List of Hazardous Chemicals, Chemical Products, Applicable Pharmaceuticals

Each affected department will maintain a list, referred to as the Chemical Inventory, of all known toxic and hazardous substances present or used within their respective work areas. A copy of the Chemical Inventory is to be maintained in the laboratory’s files and provided to the University EH&S Office. The inventory may be maintained by common chemical or trade names for each hazardous material. It is recommended to update this chemical inventory on a periodic basis (at a minimum on an annual basis or when significant additions or subtractions are made to the laboratory’s inventory).

2.9.7 Hazardous Non-Routine Tasks

If employees are required to perform potentially hazardous non-routine tasks, each affected employee will be given information by the Department Chair or supervisor about any hazardous chemicals that they may be exposed to after consultation with the University EH&S office. This information will be given to the employee prior to starting work on such projects. This information will include:

• Specific hazards.
• Protective/safety measures the employee can take.
• Measures the University has taken to lessen the hazards including ventilation, respirators, presence of another employee, and emergency procedures.

An example of a non-routine task performed by staff at the University is the cleanup of minor hazardous materials spills.
2.9.8 Informing Contractors

Employees of outside contractors performing work at the University will be informed of any hazards that they might encounter from our operations prior to the beginning of the contract work. The PIs, Department Administrators, physical facility management (PFM), and/or the University EH&S office will provide outside contractors with the following information:

- Toxic and hazardous substances to which they may be exposed while on the Howard University job site.
- Precautions the employees may need to take to reduce the possibility of exposure, such as use of appropriate protective equipment.
- The availability and location of appropriate SDSs.

The PIs, Department Administrators, PFM, and/or the University EH&S office will also be responsible for contacting each contractor before work is started within the University’s property in order to gather and disseminate any information concerning chemical hazards that the contractor may be bringing into the University. Contractors will be required to provide appropriate SDSs for review and approval as a condition of use on Howard University property.

Contractors will be required to abide by the University safety and health policies or guidelines. Violations of any such agreed upon terms may be cause for termination of the work until the condition is corrected.

2.10 CHEMICAL SPECIFIC PROCEDURES

2.10.1 Highly Hazardous Chemicals

Work with highly hazardous chemicals is often completed in research laboratories and cannot be avoided. When safer alternatives are not available, use and handling procedures can be developed and implemented with these highly hazardous chemicals. The section below defines highly hazardous chemicals based on the unique physical or toxicological properties of these compounds. Additional precautions are necessary when
using, handling, storing or disposing of these chemicals in order to maintain the optimum level of safety for laboratory and building personnel.

A risk assessment must be completed by the University EH&S Office in conjunction with research personnel, prior to working with the designated chemicals in Groups 2 and 3. The risk assessment will evaluate how the chemical is being used in the laboratory setting and determine what, if any additional engineering controls, PPE and/or administrative controls are necessary to control the hazard(s) associated with these chemicals.

Chemicals listed in Group 1 require specific guidelines, or SOPs, which must be developed by the laboratory. Researchers working with these chemicals are required to review and be trained on the corresponding guidelines prior to use.

**Note: These lists are not exhaustive.**

### 2.10.2 Highly Hazardous Designation

If a researcher reviews a SDS for a chemical and determines that it requires special precautions (e.g., respirator, localized exhaust) or has highly hazardous properties (e.g., highly toxic, air reactive, chronic health hazard) when working with the chemical, s/he must notify the University EH&S Office. This notification also applies if a chemical has a rating of 4 in one of the NFPA or the Hazardous Materials Information System (HMIS) hazard categories, since this rating indicates that the chemical is considered a highly hazardous chemical and as a result, it is covered by this Policy.

**GROUP 1**

The laboratory must develop guidelines or SOPS that must be followed when using these chemicals. Certain chemicals require air monitoring to ensure exposure is to low levels while others need proper training from the laboratory. (Note: if air monitoring is required, please contact the University EH&S Office). The EH&S online training may include information on some of these materials, however training is not all-inclusive; laboratories need to ensure their processes are safe.

- Alkali metals, (sodium, potassium, etc.)
- Anesthetic gases
- Azides (sodium azide, etc.)
- Carcinogens (known or suspected, not otherwise referenced in this list)
- Chromium hexavalent compounds
- Cyanides (potassium, sodium, etc.)
- Diaminobenzidine (DAB)
- Dimethylbenzanthracene (DMBA)
- Ethidium bromide
- Formaldehyde
- Mercury compounds
- Nitric acid with a concentration > 40%
- Organic peroxides
- Osmium tetroxide
- Oxidizing gases
- Peroxide formers (ether, 1,4 – dioxane, tetrahydrofuran, etc.)
- Perchloric acid
- O - Phenylenediamine (OPD)
- Phenol
- Picrylsulfonic acid
- Sulfuric acid with a concentration <97%
- Tamoxifen
- Taxol
- Titanium tetrachloride
- Water reactive chemicals

**GROUP 2**

These chemicals require notification to the University EH&S Office when possessed and prior to usage:

- All cholinesterase Inhibitors that are not included in Group 1
- Flammable gases
- Fuming nitric acid, sulfuric acid, hydrochloric acid
- Hydrofluoric acid
- Kainic acid
- N-ethyl-N-nitrosourea (ENU)
- Organo-mercury compounds
- Phorbol compounds

**GROUP 3**

These chemicals require approval from the University EH&S Office prior to ordering or purchasing. In addition, researchers working with these chemicals will require additional training on how to work with these chemicals.

Select Agents—Here is a list of common select agents used in a research setting. For a complete list of select agents, go to the following link: [http://www.selectagents.gov/resources/List%20of%20Select%20Agents%20and%20Toxins_111708.pdf](http://www.selectagents.gov/resources/List%20of%20Select%20Agents%20and%20Toxins_111708.pdf)
- Botulinum toxin
- Conotoxin
- Ricin
- Saxitoxin
- Staph enterotoxins
- Tetrodotoxin

Chemicals:
- Chlorine gas
- Dioxins (e.g., 2,3,7,8-tetrachlorodibenzodioxin (TCDD))
- Highly toxic (e.g., nickel carbonyl)
- Mustard gas
- Nerve agents (e.g., sarin, soman, tabun, VX)
- Neurotoxins (e.g., dimethyl mercury, 1-methyl-4-phenyl-1,2,3,6-tetrahydropyridine (MPTP), 1-methyl-4-phenylpyridinium (MPP+))
- Poisonous gases
- Pyrophorics (a.k.a. air reactive chemicals) (e.g., tert-butyl lithium)
REQUIREMENT MATRIX

The following matrix outlines the requirements for each group:

2.10.3 Chemical Facility Anti-Terrorism Standard (CFATS)

The U.S. Department of Homeland Security (DHS) has issued a Standard that imposes federal security regulations for high-risk chemical facilities. This rule establishes risk-based performance standards for the security of the nation’s chemical facilities and requires chemical facilities to prepare Security Vulnerability Assessments that identify security vulnerabilities at the facility and develop and implement Site Security Plans that include measures that satisfy the identified risk-based performance standards.

In order to determine if your facility meets the criteria for a high-risk chemical facility, the chemical inventories on campus must be reviewed. If the University manufactures, uses, stores or distributes any chemical above the Screening Threshold Quantities found in the DHS CFATS – Chemicals of Interest [http://www.dhs.gov/xlibrary/assets/chemsec_appendixa-chemicalofinterestlist.pdf](http://www.dhs.gov/xlibrary/assets/chemsec_appendixa-chemicalofinterestlist.pdf) the University must complete and submit a Chemical Security Assessment Tool (CSAT) Top-Screen available on the DHS website: [http://www.dhs.gov/files/programs/gc_1235582326154.shtm](http://www.dhs.gov/files/programs/gc_1235582326154.shtm).

2.11 PROCESS SAFETY

Unexpected releases of toxic, reactive, or flammable liquids and gases in processes involving highly hazardous chemicals have been reported for many years in various industries that use chemicals with such properties. Regardless of the industry that uses
these highly hazardous chemicals, there is a potential for an accidental release any time they are not properly controlled, creating the possibility of disaster.

The major objective of process safety management of highly hazardous chemicals is to prevent unwanted releases of hazardous chemicals especially into locations which could expose employees and others to serious hazards. An effective process safety management program requires a systematic approach to evaluating the whole process. Using this approach the process design, process technology, operational and maintenance activities and procedures, non-routine activities and procedures, emergency preparedness plans and procedures, training programs, and other elements which impact the process are all considered in the evaluation. The various lines of defense that have been incorporated into the design and operation of the process to prevent or mitigate the release of hazardous chemicals need to be evaluated and strengthened to assure their effectiveness at each level. Process safety management is the proactive identification, evaluation and mitigation or prevention of chemical releases that could occur as a result of failures in process, procedures or equipment.

Laboratory staff members, the EH&S Office, and a representative from Facilities and Engineering should be part of the team conducting the process safety analysis.

Complete and accurate written information concerning process chemicals, process technology, and process equipment is essential to an effective process safety management program and to a process hazards analysis. The compiled information will be a necessary resource to a variety of users including the team that will perform the process hazards analysis; those developing the training programs and the operating procedures; contractors whose employees will be working with the process; those conducting the pre-startup reviews; local emergency preparedness planners; and insurance and enforcement officials.

The information to be compiled about the chemicals, including process intermediates, needs to be comprehensive enough for an accurate assessment of the fire and explosion characteristics, reactivity hazards, the safety and health hazards to workers, and the corrosion and erosion effects on the process equipment and monitoring tools. Current SDS information can be used to help meet this requirement which must be supplemented
with process chemistry information including runaway reaction and over pressure hazards if applicable.

Process technology information will be a part of the process safety information package and it is expected that it will include flow chart diagrams as well as employer established criteria for maximum inventory levels for process chemicals; limits beyond which would be considered upset conditions; and a qualitative estimate of the consequences or results of deviation that could occur if operating beyond the established process limits. Employers are encouraged to use diagrams which will help users understand the process.

A block flow diagram is used to show the major process equipment and interconnecting process flow lines and show flow rates, stream composition, temperatures, and pressures when necessary for clarity. The block flow diagram is a simplified diagram.

Process flow diagrams are more complex and will show all main flow streams including valves to enhance the understanding of the process, as well as pressures and temperatures on all feed and product lines within all major vessels, in and out of headers and heat exchangers, and points of pressure and temperature control. Also, materials of construction information, pump capacities and pressure heads, compressor horsepower and vessel design pressures and temperatures are shown when necessary for clarity. In addition, major components of control loops are usually shown along with key utilities on process flow diagrams.

Piping and instrument diagrams (P&IDs) may be the more appropriate type of diagrams to show some of the above details and to display the information for the piping designer and engineering staff. The P&IDs are to be used to describe the relationships between equipment and instrumentation as well as other relevant information that will enhance clarity.

A process hazard analysis (PHA), sometimes called a process hazard evaluation, is one of the most important elements of the process safety management program. A PHA is an organized and systematic effort to identify and analyze the significance of potential hazards associated with the processing or handling of highly hazardous chemicals. A PHA provides information which will assist employers and employees in making decisions for improving safety and reducing the consequences of unwanted or unplanned releases of
hazardous chemicals. A PHA is directed toward analyzing potential causes and consequences of fires, explosions, releases of toxic or flammable chemicals and major spills of hazardous chemicals. The PHA focuses on equipment, instrumentation, utilities, human actions (routine and nonroutine), and external factors that might impact the process. These considerations assist in determining the hazards and potential failure points or failure modes in a process.

The selection of a PHA methodology or technique will be influenced by many factors including the amount of existing knowledge about the process. Is it a process that has been operated for a long period of time with little or no innovation and extensive experience has been generated with its use? Or, is it a new process or one which has been changed frequently by the inclusion of innovative features? Also, the size and complexity of the process will influence the decision as to the appropriate PHA methodology to use. All PHA methodologies are subject to certain limitations. For example, the checklist methodology works well when the process is very stable and no changes are made, but it is not as effective when the process has undergone extensive change. The checklist may miss the most recent changes and consequently the changes would not be evaluated. Another limitation to be considered concerns the assumptions made by the team or analyst. The PHA is dependent on good judgment and the assumptions made during the study need to be documented and understood by the team and reviewer and kept for a future PHA.

2.12 WORKING WITH ANIMALS

The Institutional Animal Care and Use Committee (IACUC) has issued Guidelines and information for researchers and caregivers that addresses regulatory compliance, animal use, animal care, hazards and related issues (including the NIH Assurance) in relation to laboratory work with animals. These guidelines can be obtained from IACUC and the procedures should be followed for any research work involving animals. Information about the University IACUC can be found on Office of Regulatory Research Compliance (ORRC) website at www.howard.edu/orrc
2.13 LABORATORY INSPECTION PROTOCOL

2.13.1 Preparation

The following tasks are to be completed prior to the laboratory inspection:

- Research the principal investigator (PI) and the associated department to determine what is being performed in the laboratory; (This can be accomplished by searching the PI's name or the department on Google; reviewing the PI's research application with the Howard University Institutional Biosafety Committee (IBC); etc.)
- Read the previous laboratory inspection reports; look for reoccurring observations;
- Review the chemical inventory for each room associated with the PI (Are there any highly hazardous chemicals? Refer to the Highly Hazardous Chemical SOP; (section 2.10 provides more information)
- Verify that the chemical inventory was reviewed and updated in the past year;
- Review hazardous waste work orders associated with the PI;
- Review the Evacuation Plan for the laboratory and/or office area(s), confirm they are correct and were submitted in the last year;
- Contact PI/Laboratory Manager/Safety Contact to schedule the laboratory inspection; and
- Provide PI/Laboratory Manager/Safety Contact a copy of the laboratory inspection form for their review and use.

2.13.2 Inspection

2.13.2.1 General Inspection

With laboratory contact, the inspector should:

- Introduce himself/herself with a brief description of his/her role within the EH&S Office and his/her experience.
- Provide a description of the laboratory inspection process.
- Compare the NFPA 704 signage with the chemical inventory.
- Confirm that the NFPA 704 sign is current and correct.
- Tour laboratory areas associated with the PI/Laboratory Manager/Safety Contact (laboratory bench top areas, storage areas, and common areas [i.e., equipment halls]).
NOTE: The PI/Laboratory Manager/Safety Contact can either stay with the inspector or leave at this point. It is up to the PI/Laboratory Manager/Safety Contact whether or not s/he wants to stay or not. However, it is preferred that the PI/Laboratory Manager/Safety Contact stay so that s/he witnesses the entire inspection.

2.13.2.2 Detailed Inspection

With or without PI/Laboratory Manager/Safety Contact, the inspector should:

- Use laboratory inspection form to determine compliance with applicable regulations and best management practices.
- Inspect work practices in the laboratory.
  - Are researchers wearing PPE such as laboratory coats, gloves and/or face/eye protection (as appropriate) when working with hazardous chemicals?
  - Have someone show where the PPE is stored and how they dispose of contaminated PPE.
  - Ensure all laboratory and administrative personnel have attended the appropriate EH&S training within the past year.
  - Ensure equipment (e.g., freezers) and building (e.g., HVAC system; chemical fume hoods, etc.) is functioning properly.
- Conduct a thorough inspection of the Chemical Storage Areas within the laboratory for proper storage. This means look at every bottle of hazardous chemical. Here are some guidelines:
  - Ensure flammables are stored in rated cabinets
  - Ensure acids are stored in acid rated cabinets
  - Ensure bases are stored in base rated cabinets
  - Check to see if peroxide formers are stored properly; appear in good condition; are not past or approaching expiration date
  - Ensure water reactive chemicals are stored together and away from moisture
  - Ensure all chemicals that pose significant risk have an SOP outlining their safe usage
  - Ensure chemicals are stored by chemical compatibility not alphabetically
  - Ensure containers of hazardous chemicals are labeled with the name of the chemical and the hazard associated with it. Also, recommend that all containers be labeled with their contents for emergency response assistance.
• Open every drawer, freezer, refrigerator, cabinet, etc. to ensure no chemicals are being improperly stored in the laboratory area.

2.13.2.3 Document and Inspection Review
After detailed inspection, meet the PI/Laboratory Manager/Safety Contact, to review the laboratory inspection and EH&S practices associated with his/her laboratory. Use the inspection form as a guide for this phase of the inspection:

• Does the laboratory know how to obtain regulatory documents (i.e., EH&S/Safety Manual; Chemical Hygiene Plan)?
• Who are the appropriate contacts for incidents and emergencies?
• What are the appropriate procedures for incidents and emergencies?
• Discuss the observations associated with the inspection using regulatory or scientific information to support observation.
• Provide ways to improve compliance with EH&S.
• Answer any questions; if you are unsure of the answer, indicate that you need to research the item and you will follow-up with a phone call with the supporting information.
• Inform them that the inspection report will be sent to Laboratory Manager/Safety Contact and the PI via e-mail for their use and review, indicating any corrective measures to be completed in 30 days
• Another inspection will be conducted after the inspection report is submitted to the EH&S Office to confirm that the observations have been corrected by the laboratory.

2.13.3 Follow-Up

• Respond via phone with any information requested during the inspection. Document conversation in a log book.
• Enter information into the inspection database.
• Have another EH&S staff member proof read the inspection report before generating it.
• Generate inspection report in a pdf format.
• Submit inspection report to PI/Laboratory Manager/Safety Contact.
• If the inspection report is not submitted back to the EH&S Office within one month, contact the PI/Laboratory Manager/Safety Contact to determine the status of the inspection report observations.

2.14 RECORD KEEPING

It is important to maintain a complete record of EH&S related matters including training records, hazard evaluations, inspection results, incident reports, hazardous waste manifests, etc. In the event that a regulatory agency inspects, these records may need to be available to produce upon request by the inspector. Ensure that record keeping is in compliance with all applicable regulations pertaining to the laboratory as stated in Section 2.2.
